Emergency Handling Procedure

1. Tasks and goals of emergency planning

To better meet the requirements of laws and economic activities and to provide a safer work environment for our employees and for the residents around construction sites; to make sure that various emergency response resources are in a good state of preparedness; to guide emergency response actions to be carried out in an orderly manner as scheduled to prevent delays in emergency rescue for accidents as a result of the poor organization of emergency response actions or the disorder and chaos of on-site rescue operations; to effectively avoid or reduce casualties and property losses; to assist in carrying out rapid, orderly and efficient emergency response actions; and to fully demonstrate the “spirit of emergency preparedness” in emergency rescue.

2. Emergency rescue office

Our emergency response office under emergency rescue planning for construction- and production safety-related accidents comprises first and second grade divisions. A first-grade emergency response division has been set up at the Company’s headquarters to carry out emergency response planning, and a second-grade emergency response division has been set up at the engineering project management department to carry out emergency plans.

3. Define the duties and division of work for the emergency handling office

The office comprises of a commander-in-chief, a rescue team, a logistics team, a technical processing team, a remedial work team and an accident investigation team, which carry out a detailed investigation into and a report on an accident.

4. Training for and promotion of emergency handling

After emergency plans and emergency procedures are established, all the staff of the Company’s headquarters and construction project department will receive effective training according to the plans, enabling them to acquire the knowledge

and skills required to complete their emergency tasks.

5. Drills and preparation of apparatus for emergency handling

The Company arranges emergency drills every year and allocates a certain percentage of the expenses for the purchase of specific emergency apparatus and equipment on a selective basis, in line with the nature and features of the Company's production as well as the actual needs of emergency work. After emergency planning is activated, the Company's mechanical equipment and transportation vehicles are included into the emergency work on a centralized basis. The list of the relevant emergency drills is attached hereafter.

6. Evaluation of emergency handling

To evaluate the whole process for the implementation of emergency plans carefully and scientifically, and thus to overcome the shortcomings and defects in emergency plans, which serve as reference cases and to improve the establishment, formulation and modification of emergency plans in the future.

7. We will review this policy every year.

List

Emergency plans for accidents involving Company's construction and production safety

Emergency drill for accidents involving food poisoning

Emergency drill for accidents involving electric shocks

Emergency drill for accidents involving falling objects

Emergency drill for accidents involving collapses

Emergency drill for fire accidents
